Controlling Variable(s)
Ability to act (financial and other resources)
Knowledge about what to do
The controlling variable is the particular aspect of a system that controls whether or not it will move towards or away from a threshold point.
Most Appropriate / Preferred Management Actions
Contribute towards maintaining the region's cultural heritage
Contribute to protecting and maintaining Cultural Intellectual property
Contribute towards maintaining the region's cultural heritage
Contribute to protecting and maintaining Cultural Intellectual property
Key Shocks
Political changes
Legislative changes
Main Drivers
Climate change
Economic impacts (individual financial stability)
DESIRED STATE
Supportive community*
Places with cultural heritage have been systematically and comprehensively identified and included in relevant inventories or reserves
Cultural heritage places are in very good condition with identified values retaining a high degree of integrity
Current and predicted impacts or pressures should have little effect on the heritage values of individual places (e.g. loss of knowledge and traditional cultural practice, incremental destruction of sites)
TRANSITION STATE
Informed / aware community
Some places with cultural heritage value have been systematically identified and included in relevant inventories or reserves
Heritage places are in fair condition but their values may lack integrity
Current and predicted impacts or pressures are likely to have some effect on the heritage values of individual places and some landscapes (e.g. loss of knowledge and traditional cultural practice, incremental destruction of sites)
UNDESIRED STATE
Disconnected Community
Places with heritage values have not been identified
Heritage places are in degraded condition and their values lack integrity
Current and predicted impacts or pressures are wide ranging and if unchecked, will irreversibly affect the heritage values of individual places and landscapes (e.g. loss of knowledge and traditional cultural practice, incremental destruction of sites)
Thresholds or Tipping Points
Thresholds exist between states and are yet to be defined fully.
Specific thresholds relating to the controlling variable also vary across the region.
Regional Threats
Loss or degradation of Aboriginal knowledge and heritage
Loss or degradation of natural and historic heritage
Inadequate resourcing
